(8) Inheritance practices tend toward a slow but continuous fragmentation of land due to the need of establishing branch households. This tendency toward fragmentation is seldom overcome by reversing the process in favor of some form of land consolidation. The major obstacles to consolidation will be dealt with in the next chapter. Fragmentation is more likely to occur in the holdings of the more well-to-do who have property to divide. Among the very poor, whose holdings are small and scattered, there is an enforced primogeniture. It is not possible to divide land indefinitely. The smaller a piece of land, the more likely it will be surrounded by land owned by others, and these isolated islands are difficult either to sell or trade. 428 423 [565]

(9) Among the fishermen of Hinatogawa, practices applied to real, personal, and movable property, are similar to those of the agricultural villages (nōson). Here the influence of the family system is more on the disposition of personal than of real property, but the effects, if not the rewards, are similar. If a fisherman has dry crop fields--there is no rice land--the elder son receives all, or most of the land. All informants stressed the weight of the individual desire of the father, whose division of property is influenced by the spirit, sobriety, and dependability of his sons. Here there is also the same social disapproval of selling inherited land. The fishermen attempt to supply second sons with small boats, nets, hooks, and other gear, just as the farmer attempts to give land, domestic animals, and agricultural tools. With the very poor, second and third sons may have to be content with nothing or with a few articles of clothing. Among those fishermen who have land, the principle is established that the first son gets the greater part, if not all, of the real property. 428 423 422 [425]

Mechanics of Land Division

Ownership is scattered; individuals own different types of land in varying proportions and in varying grades within types. Plots of land are small in area. Rice plots are normally the smallest, followed in general in ascending order by dry crop fields, and the wild land (genya). It is from such conditions as these that the difficulties in fairness of division arise. 423 311

The following illustrations show the manner in which division is usually carried out. Let us for simplicity first assume four parcels of land:

#1, a house site
#2, a parcel of 700 tsubo third grade dry crop land (hatake)
#3, 500 tsubo of grade one dry crop land, inconvenient and far away from the home, and
#4, 1000 tsubo of grade two hatake.

quire room and board are sometimes put up without compensation, and they agree, perhaps, to give some help with studies of the landlord's children. Only the village "doctor" takes transient guests, mostly visiting officials from the city, who pay for lodgings.

Although the household head is a legal owner of the family property, there is a feeling that it belongs to the family and everyone in the household identifies himself with his land and house. This is expressed in the language. A person who is asked, "Whose rice paddy is this?" would answer that it is the household's or "ours."

In addition to the communal land holdings and the property of the cooperative described earlier, the following items are shared. The government supplies a breeding boar to each village; it is then left in the care of one farmer. This animal is available to pig owners for studding on request, and a small charge is made for the upkeep of the boar. A few tools are jointly owned by several households. Threshing machines were bought jointly after the war by two or more families to defray the high cost of such equipment. These families could be neighbors or relatives. Today many are complaining that joint ownership works hardships during the busy harvest season when there is heavy demand for the machines. As a result, everybody wishes to own his own machine as soon as he can afford to. For tea harvesting, special clippers are owned by the village cooperative and loaned to people as they need them. Since tea harvesting, though seasonal, is not done by all families during the same day, sharing of these tools presents no difficulties.

Property of others is very much respected. Stealing among villagers is almost unheard of, except for some pilfering of green vegetables and fruits by children. Only one case was reported during the field-work period—a person tried to take some goods without payment from the community store. When a village meeting was called, and it was announced that the person's identity was known to the store manager, the merchandise was later replaced. Willful damage to fields is similarly strictly forbidden. No child would really think of doing such damage. But there are no formal rules about trespassing. Movement across other people's property is completely free and unchallenged.
